Despite a period of eclipse in the 1930s, after the introduction of European faces like Kabel and Futura, they were re-discovered by American designers in the 1940s and have remained popular ever since.

Benton's Franklin Gothic family is a set of solid designs, particularly suitable for display and trade use such as headlines rather than for extended text. Many versions and adaptations have been made since.

Probably the best-known extension of Franklin Gothic is Victor Caruso's 1970s ITC Franklin Gothic, which expands the series to include book weights similar to Benton's News Gothic in a high x-height 1970s style.

Franklin Gothic itself is an extra-bold sans-serif type. It draws upon earlier, nineteenth century models, from many of the twenty-three foundries consolidated into American Type Founders in 1892. Historian Alexander Lawson speculated that Franklin Gothic was influenced by Berthold's Akzidenz-Grotesk types but offered no evidence to support this theory which was later presented as fact by Philip Meggs and Rob Carter. It was named in honor of a prolific American printer, Benjamin Franklin. The faces were issued over a period of ten years, all of which were designed by Benton and issued by A.T.F. It can be distinguished from other sans serif typefaces by its more traditional double-storey a and especially g (double-storey gs, common in serif fonts, are rare in sans-serif fonts following German models, but were quite common in American and British designs of the period), the tail of the Q and the ear of the g. The tail of the Q curls down from the center of the letterform. Morris Fuller Benton (November 30, 1872 – June 30, 1948) was an American typeface designer who headed the design department of the American Type Founders (ATF), for which he was the chief type designer from 1900 to 1937.

Many of Benton's designs, such as his large family of related sans-serif or "gothic" typefaces, including Alternate Gothic, Franklin Gothic, and News Gothic, are still in everyday use. Benton is credited as America's most prolific designer of metal type, having (with his team) completed 221 typefaces, including revivals of historical models, like Bodoni and Cloister; original designs, such as Hobo, Bank Gothic, and Broadway; and adding new weights to existing faces, such as Century, Goudy Old Style and Cheltenham. Although he did not invent the concept, Benton working at ATF pioneered the concept of families of typeface designs, allowing consistency of appearance in different sizes, widths and weights. This allowed ATF to capitalise on a successful typeface's popularity and facilitated coherent layout and graphic design; its 1923 specimen book described its approach of creating families which could allow advertisers to "talk at command with varying emphasis and orchestral power [rather than using] a medley of display types." Benton worked as the team leader of designers responsible for creating a basic design and then adapting it to dif-

Benton was relatively retiring in life: a 1936 interview described him as “one of the most difficult men to interview I have ever talked to... try to pin some honour on him, or give him credit for some achievement, and he will modestly sidestep with the remark that ‘Lady Luck helped me a lot there!’” In addition to his strong aesthetic design sense, Benton was a master of the technology of his day. He read mechanical engineering at Cornell University, graduating in 1896. His father, Linn Boyd Benton, invented the pantographic engraving machine, which was capable not only of scaling a single font design pattern to a variety of sizes while compensating for the size change, but could also condense, extend, and slant the design (mathematically, these are cases of affine transformation, which is the fundamental geometric operation of most systems of digital typography today, including PostScript). Morris used these machines with his father at ATF, during which these machines were refined to an impressive level of precision. Theo Rehak, the current owner of much ATF typesetting equipment, and author of the definitive treatise

Most modern machine shops are equipped to measure down to one thousandth of an inch. As an advertising device, in 1922 ATF manufactured a piece of type eight points tall (0.11 inch) containing the entire Lord's Prayer in 13 lines of text, using a cutting tool roughly equivalent to a 2000-dpi printer. American Type Founders (ATF) was a business trust created in 1892 by the merger of 23 type foundries, representing about 85% of all type manufactured in the United States. The new company, consisting of a consolidation of firms from throughout the United States, was incorporated in New Jersey. ATF was the dominant American manufacturer of metal type from its creation in 1892 until at least the 1940s; it continued to be influential into the 1960s. Many fonts developed by American Type Founders in its period of dominance, including News Gothic, Century Schoolbook, Franklin Gothic, Hobo and Bank Gothic, are still in everyday use. By the beginning of the final decade of the nineteenth century, type founding was in a state of crisis. With the introduction of the Linotype, which could

Throughout the late 1880s prices had been maintained by an informal cartel of foundries, but as the number of foundries increased, and then with the invention of hot metal type, prices dropped dramatically. Additionally, type at this time was not standardized, either to body size or to base line, and printers resented the incompatibility of types from different foundries. Leaders in the industry, notably Joseph W. Phinney of the Dickinson Type Foundry in Boston, set up a committee to address these problems, eventually recommending consolidation. By the late 1880s, there were some 34 foundries in the United States. In 1892, 23 foundries were brought together to form the American Type Founders Company. Key to the success of this merger was the inclusion of MacKellar, Smiths, & Jordan Co. of Philadelphia, with assets of over \$6 million, the Cincinnati Type Foundry of Henry Barth, which brought with it the patents to his Barth Typecaster, and Benton, Waldo Foundry of Milwaukee, which included Linn Boyd Benton and his all-important

Before that time, the physical masters for each new font had to be cut as a series of steel punches or softer-metal patrices, depending on the exact point size. Steel punches could strike bars of copper as the first step in matrix-making, while soft-metal patrices would have matrices grown around them via electrotyping instead. Staff photographers may have resized images shot from a master drawing — or a print from a trial size of the type — for punchcutters to engrave onto their punches/patrices, where they could follow as a guide. The then still-larger Schelter & Giesecke foundry at Leipzig had been using pantographs to scale letter drawings down to type size by 1894, for instance, and could even trace outlines onto the faces of punches and patrices this way. While Schattierte Grotesk and Akzidenz-Grotesk really were new designs when they were published, they were not atypical products. Many of their letterforms bear resemblance to earlier sans serifs that had already been published in and outside of Germany. Nevertheless, they

With the inclusion of the Barth Caster and the Benton Pantograph, ATF immediately became the largest and the most technologically advanced foundry in the world. Conditions for the first few years were chaotic: while 12 foundries ceased separate operations immediately member foundries continued to operate as if they were independent firms. Real consolidation did not begin until 1894, when Robert Wickham Nelson, principal owner of the Throne Typesetting Machine Company and a new stockholder in ATF, became general manager. He immediately began to liquidate unprofitable ventures, eliminate duplications, and force the various branches to do business under the ATF name instead of retaining their former ones. Linn Boyd Benton's son, Morris Fuller Benton, was given the job of purging obsolete and duplicated type faces from the catalogs, and standardizing the point size and base-line of the types made. Nelson, realizing that display and advertising type (rather than the body type that was set so

It is in part bundled with Microsoft Windows. Franklin Gothic itself is an extra-bold sans-serif type. It draws upon earlier, nineteenth century models, from many of the twenty-three foundries consolidated into American Type Founders in 1892. Historian Alexander Lawson speculated that Franklin Gothic was influenced by Berthold’s Akzidenz-Grotesk types but offered no evidence to support this theory which was later presented as fact by Philip Meggs and Rob Carter. It was named in honor of a prolific American printer, Benjamin Franklin. The faces were issued over a period of ten years, all of which were designed by Benton and issued by A.T.F. It can be distinguished from other sans serif typefaces by its more traditional double-storey a and especially g (double-storey gs, common in serif fonts, are rare in sans-serif fonts following German models, but were quite common in American and British designs of the period), the tail of the Q and the ear of the g. The tail of the Q curls down from the center of the letterform. Morris Fuller Benton (November 30, 1872 – June 30, 1948) was an American typeface designer who headed the design department of the American Type Founders (ATF), for which he was the chief type designer from 1900 to 1937. Many of Benton’s designs, such as his large family of related sans-serif or “gothic” typefaces, including Alternate Gothic, Franklin Gothic, and News Gothic, are still in everyday use. Benton is credited as America’s most prolific designer of metal type, having (with his team) completed 221 typefaces, including revivals of historical models, like Bodoni and Cloister; original designs, such as Hobo, Bank Gothic, and Broadway; and adding new weights to existing faces, such as Century, Goudy Old Style and Cheltenham. Although he did not invent the concept, Benton working at ATF pioneered the concept of families of typeface designs, allowing consistency of appearance in different sizes, widths and weights. This allowed ATF to capitalise on a successful typeface’s popularity and facilitated coherent layout and graphic design; its 1923 specimen book described its approach of creating families which could allow advertisers to “talk at command with varying emphasis and orchestral power [rather than using] a medley of display types.” Benton worked as the team leader of designers responsible for creating a basic design and then adapting it to different sizes and weights. He considered his work as a designer important and wrote a brief list of typefaces he considered his most important work in 1936, shortly before his retirement. Benton was relatively retiring in life: a 1936 interview described him as “one of the most difficult men to interview I have ever talked to... try to pin some honour on him, or give him credit for some achievement, and he will modestly sidestep with the remark that ‘Lady Luck helped me a lot there!’” In addition to his strong aesthetic design sense, Benton was a master of the technology of his day. He read mechanical engineering at Cornell University, graduating in 1896. His father, Linn Boyd Benton, invented the pantographic engraving machine, which was capable not only of scaling a single font design pattern to a variety of sizes while compensating for the size change, but could also condense, extend, and slant the design (mathematically, these are cases of affine transformation, which is the fundamental geometric operation of most systems of digital typography today, including PostScript). Morris used these machines with his father at ATF, during which these machines were refined to an impressive level of precision. Theo Rehak, the current owner of much ATF typesetting equipment, and author of the definitive treatise Practical Typesetting, explains that the Bentons demanded that any deviation in			
chine, which was capable not only of scaling a single font design pattern to a variety of sizes while compensating for the size change, but could also condense, extend, and slant the design (mathematically, these are cases of affine transformation, which is the fundamental geometric operation of most systems of digital typography today, including PostScript). Morris used these machines with his father at ATF, during which these machines were refined to an impressive level of precision. Theo Rehak, the current owner of much ATF typesetting equipment, and author of the definitive treatise Practical Typesetting, explains that the Bentons demanded that any deviation in			
machining or casting be within two ten-thousandths of an inch. Most modern machine shops are equipped to measure down to one thousandth of an inch. As an advertising device, in 1922 ATF manufactured a piece of type eight points tall (0.11 inch) containing the entire Lord’s Prayer in 13 lines of text, using a cutting tool roughly equivalent to a 2000-dpi printer. American Type Founders (ATF) was a business trust created in 1892 by the merger of 23 type foundries, representing about 85% of all type manufactured in the United States. The new company, consisting of a consolidation of firms from throughout the United States, was incorporated in New Jersey. ATF was the dominant American manufacturer of metal type from its creation in 1892 until at least the 1940s; it continued to be influential into the 1960s. Many fonts developed by American Type Founders in its period of dominance, including News Gothic, Century Schoolbook, Franklin Gothic, Hobo and Bank Gothic, are still in everyday use. By the beginning of the final decade of the nineteenth century, type founding was in a state of crisis. With the introduction of the Linotype, which could cast whole lines of body type in-house, demand for hand-set type was down. Throughout the late 1880s prices had been maintained by an informal cartel of foundries, but as the number of foundries increased, and then with the invention of hot metal type, prices dropped dramatically. Additionally, type at this time was not standardized, either to body size or to base line, and printers resented the incompatibility of types from different foundries. Leaders in the industry, notably Joseph W. Plinney of the Dickinson Type Foundry in Boston, set up a committee to address these problems, eventually recommending consolidation. By the late 1880s, there were some 34 foundries in the United States. In 1892, 23 foundries were brought together to form the American Type Founders Company. Key to the success of this merger was the inclusion of MacKellar, Smiths, & Jordan Co. of Philadelphia, with assets of over \$6 million, the Cincinnati

Ordinals

ordn

2nd 3rd M^{me}

Ordinals are optically adjusted, small, raised lowercase letters. You can use them for numerical abbreviations like 1st, 2nd, 3rd and in languages like French for 1^e or M^{me}.

Fractions

frac

1/2 cup 53/82 inch

Dynamic fractions will automatically substitute for pre-built and arbitrary fractions.

Subscript

subs

H₂O C₂H₆O

Subscripts are optically adjusted, small lowered numerals. They usually sit below the baseline. You can use them for chemical formulae, like H₂O.

Superscript

sup

The footnote.⁵

Superscripts are optically adjusted, small raised numerals. You can use them for footnote references in running text,¹ chemistry notation (²H) and mathematical exponents (x³).

OpenType features

Case-sensitive forms

case

1-5 (R/G) ‹‹Q››

Punctuation designed specifically to align with capital letters.

Contextual alternates

calt

4:20pm 12×5

Alternates that intelligently substitute depending on context. The raised colon will only appear between numerals to indicate time. The multiplication sign will only substitute x or X for × between numerals.

Slashed Zero

zero

100 Ostriches

Slashed zero differentiates the zero from an upper or lowercase o as clearly as possible.

Tabular lining numerals

tnum

0123456789

Tabular lining numerals all share the same width. You can use them to align columns of data or a price list, for example. The associated currency and math symbols also have the same width.

Benton's Franklin Gothic family is a set of solid designs, particularly suitable for display and trade use such as headlines rather than for extended text.

Benton's work gives me a sense of the man-machine. His letterforms are pleasantly unfussy and plain. They're obviously well designed, his functional groundwork was never overrun by mannerism. He was comfortable working with modern tools to achieve his vision.

Franklin Gothic and its related faces are a large family of sans-serif typefaces in the industrial or grotesque style developed in the early years of the 20th century by the type foundry American Type Founders (ATF) and credited to its head designer Morris Fuller Benton. “Gothic” was a contemporary term (now little-used except to describe period designs) meaning sans-serif. Franklin Gothic has been used in many advertisements and headlines in newspapers. The typeface continues to maintain a high profile, appearing in a variety of media from books to billboards. Despite a period of eclipse in the 1930s, after the introduction of European faces like Kabel and Futura, they were re-discovered by American designers in the 1940s and have remained popular ever since. Benton’s Franklin Gothic family is a set of solid designs, particularly suitable for display and trade use such as headlines rather than for extended text. Many versions and adaptations have been made since. Probably the best-known extension of Franklin Gothic is Victor Caruso’s 1970s ITC Franklin Gothic, which expands the series to include book weights similar to Benton’s News Gothic in a high x-height 1970s style. It is in part bundled with Microsoft Windows. Franklin Gothic itself is an extra-bold sans-serif type. It draws upon earlier, nineteenth century models, from many of the twenty-three foundries consolidated into American Type Founders in 1892. Historian Alexander Lawson speculated that Franklin Gothic was influenced by Berthold’s Akzidenz-Grotesk

Throughout the late 1880s prices had been maintained by an informal cartel of foundries, but as the number of foundries increased, and then with the invention of hot metal type, prices dropped dramatically. Additionally, type at this time was not standardized, either to body size or to base line, and printers resented the incompatibility of types from different foundries. Leaders in the industry, notably Joseph W. Phinney of the Dickinson Type Foundry in Boston, set up a committee to address these problems, eventually recommending consolidation. By the late 1880s, there were some 34 foundries in the United States. In 1892, 23 foundries were brought together to form the American Type Founders Company. Key to the success of this merger was the inclusion of MacKellar, Smiths, & Jordan Co. of Philadelphia, with assets of over \$6 million, the Cincinnati Type Foundry of Henry Barth, which brought with it the patents to his Barth Typecaster, and Benton, Waldo Foundry of Milwaukee, which included Linn Boyd Benton and his all-important Benton Pantograph which engraved type matrices directly instead of using punches and allowed the optical scaling of type.

0

Before that time, the physical masters for each new font had to be cut as a series of steel punches or softer-metal matrices, depending on the exact point size. Steel punches could strike bars of copper as the first step in matrix-making, while soft-metal matrices would have matrices grown around them via electrotyping instead. Staff photographers may have resized images shot from a master drawing — or a print from a trial size of the type — for punch-cutters to engrave onto their punches/matrices, where they could follow as a guide. The then still-larger Schelter & Giesecke foundry at Leipzig had been using pantographs to scale letter drawings down to type size by 1894, for instance, and could even trace outlines onto the faces of punches and matrices this way. While Schattierte Grotesk and Akzidenz-Grotesk really were new designs when they were published, they were not atypical products. Many of their letterforms bear resemblance to earlier sans serifs that had already been published in and outside of Germany. Nevertheless, they seem to me to be more of a synthesis of then-current ideas of sans serif letterform design, rather than copies of any specific products from other firms. The name

With the inclusion of the Barth Caster and the Benton Pantograph, ATF immediately became the largest and the most technologically advanced foundry in the world. Conditions for the first few years were chaotic: while 12 foundries ceased separate operations immediately member foundries continued to operate as if they were independent firms. Real consolidation did not begin until 1894, when Robert Wickham Nelson, principal owner of the Throne Typesetting Machine Company and a new stockholder in ATF, became general manager. He immediately began to liquidate unprofitable ventures, eliminate duplications, and force the various branches to do business under the ATF name instead of retaining their former ones. Linn Boyd Benton's son, Morris Fuller Benton, was given the job of purging obsolete and duplicated type faces from the catalogs, and standardizing the point size and base-line of the types made. Nelson, realizing that display and advertising type (rather than the body type that was set so efficiently by the new line-casters) would be the mainstay of the foundry type business, immediately began an extensive advertising campaign and commis-

Franklin Gothic and its related faces are a large family of sans-serif typefaces in the industrial or grotesque style developed in the early years of the 20th century by the type foundry American Type Founders (ATF) and credited to its head designer Morris Fuller Benton. "Gothic" was a contemporary term (now little-used except to describe period designs) meaning sans-serif. Franklin Gothic has been used in many advertisements and headlines in newspapers. The typeface continues to maintain a high profile, appearing in a variety of media from books to billboards. Despite a period of eclipse in the 1930s, after the introduction of European faces like Kabel and Futura, they were re-discovered by American designers in the 1940s and have remained popular ever since. Benton's Franklin Gothic family is a set of solid designs, particularly suitable for display and trade use such as headlines rather than for extended text. Many versions and adaptations have been made since. Probably the best-known extension of Franklin Gothic is Victor Caruso's 1970s ITC Franklin Gothic, which expands the series to include book weights similar to Benton's News Gothic in a high x-height 1970s style. It is in part bundled with Microsoft Windows. Franklin Gothic itself is an extra-bold sans-serif type. It draws upon earlier, nineteenth century models, from many of the twenty-three foundries consolidated into American Type Founders in 1892. Historian Alexander Lawson speculated that Franklin Gothic was influenced by Berthold's Akzidenz-Grotesk types but offered no evidence to support this theory which was later presented as fact by Philip Meggs and Rob Carter. It can be distinguished from other sans serif typefaces by its more traditional double-storey a and especially g (double-storey gs, common in serif fonts, are rare in sans-serif fonts following German models, but were quite common in American and British designs of the period), the tail of the Q and the ear of the g. The tail of the Q curls down from the center of the letterform. Morris Fuller Benton (November 30, 1872 – June 30, 1948) was an American typeface designer who headed the design department of the American Type Founders (ATF), for which he was the chief type designer from 1900 to

1937. Many of Benton's designs, such as his large family of related sans-serif or "gothic" typefaces, including Alternate Gothic, Franklin Gothic, and News Gothic, are still in everyday use. Benton is credited as America's most prolific designer of metal type, having (with his team) completed 221 typefaces, including revivals of historical models, like Bodoni and Cloister; original designs, such as Hobo, Bank Gothic, and Broadway; and adding new weights to existing faces, such as Century, Goudy Old Style and Cheltenham. Although he did not invent the concept, Benton working at ATF pioneered the concept of families of typeface designs, allowing consistency of appearance in different sizes, widths and weights. This allowed ATF to capitalise on a successful typeface's popularity and facilitated coherent layout and graphic design; its 1923 specimen book described its approach of creating families which could allow advertisers to "talk at command with varying emphasis and orchestral power [rather than using] a medley of display types." Benton worked as the team leader of designers responsible for creating a basic design and then adapting it to different sizes and weights. He considered his work as a designer important and wrote a brief list of typefaces he considered his most important work in 1936, shortly before his retirement. Benton was relatively retiring in life: a 1936 interview described him as "one of the most difficult men to interview I have ever talked to... try to pin some honour on him, or give him credit for some achievement, and he will modestly sidestep with the remark that 'Lady Luck helped me a lot there!'" In addition to his strong aesthetic design sense, Benton was a master of the technology of his day. He read mechanical engineering at Cornell University, graduating in 1896. His father, Linn Boyd Benton, invented the pantographic engraving machine, which was capable not only of scaling a single font design pattern to a variety of sizes while compensating for the size change, but could also condense, extend, and slant the design (mathematically, these are cases of affine transformation, which is the fundamental geometric operation of most systems of digital typography today, including PostScript). Morris used these machines with his father at ATF, during which these machines were refined to an impressive level of precision. Theo Rehak, the current owner of much ATF typecasting equipment, and

Ordinals

ordn

2nd 3rd M^{me}

Ordinals are optically adjusted, small, raised lowercase letters. You can use them for numerical abbreviations like 1st, 2nd, 3rd and in languages like French for 1^e or M^{me}.

Fractions

frac

1/2 cup 53/82 inch

Dynamic fractions will automatically substitute for pre-built and arbitrary fractions.

Subscript

subs

H₂O C₂H₆O

Subscripts are optically adjusted, small lowered numerals. They usually sit below the baseline. You can use them for chemical formulae, like H₂O.

Superscript

sups

The footnote.⁵

Superscripts are optically adjusted, small raised numerals. You can use them for footnote references in running text,¹ chemistry notation (²H) and mathematical exponents (x³).

OpenType features

Case-sensitive forms

case

1-5 (R/G) ‹‹Q››

Punctuation designed specifically to align with capital letters.

Contextual alternates

calt

4:20pm 12×5

Alternates that intelligently substitute depending on context. The raised colon will only appear between numerals to indicate time. The multiplication sign will only substitute x or X for × between numerals.

Slashed Zero

zero

100 Ostriches

Slashed zero differentiates the zero from an upper or lowercase o as clearly as possible.

Tabular lining numerals

tnum

0123456789

Tabular lining numerals all share the same width. You can use them to align columns of data or a price list, for example. The associated currency and math symbols also have the same width.

Franklin Gothic and its related faces are a large family of sans-serif typefaces in the industrial or grotesque style developed in the early years of the 20th century by the type foundry American Type Founders (ATF) and credited to its head designer Morris Fuller Benton.

48pt

Light

0

“Gothic” was a contemporary term (now little-used except to describe period designs) meaning sans-serif.

48pt

Regular

0

Franklin Gothic has been used in many advertisements and headlines in newspapers.

48pt

Medium

0

The typeface continues to maintain a high profile, appearing in a variety of media from books to billboards.

48pt

Bold

0

Despite a period of eclipse in the 1930s, after the introduction of European faces like Kabel and Futura, they were re-discovered by American designers in the 1940s

Benton's Franklin Gothic family is a set of solid designs, particularly suitable for display and trade use such as headlines rather than for extended text.

Probably the best-known extension of Franklin Gothic is Victor Caruso's 1970s ITC Franklin Gothic.

Ordinals

ordn

2nd 3rd M^{me}

Ordinals are optically adjusted, small, raised lowercase letters. You can use them for numerical abbreviations like 1st, 2nd, 3rd and in languages like French for 1^e or M^{me}.

Fractions

frac

1/2 cup 53/82 inch

Dynamic fractions will automatically substitute for pre-built and arbitrary fractions.

Subscript

subs

H₂O C₂H₆O

Subscripts are optically adjusted, small lowered numerals. They usually sit below the baseline. You can use them for chemical formulae, like H₂O.

Superscript

sups

The footnote.⁵

Superscripts are optically adjusted, small raised numerals. You can use them for footnote references in running text,¹ chemistry notation (²H) and mathematical exponents (x³).

OpenType features

Case-sensitive forms

case

1-5 (R/G) «Q»

Punctuation designed specifically to align with capital letters.

Contextual alternates

calt

4:20pm 12×5

Alternates that intelligently substitute depending on context. The raised colon will only appear between numerals to indicate time. The multiplication sign will only substitute x or X for × between numerals.

Slashed Zero

zero

100 Ostriches

Slashed zero differentiates the zero from an upper or lowercase o as clearly as possible.

Tabular lining numerals

tnum

0123456789

Tabular lining numerals all share the same width. You can use them to align columns of data or a price list, for example. The associated currency and math symbols also have the same width.
